**DLPC4430** DLPS223 - DECEMBER 2021

# **DLPC4430 DLP® Display Controller**

## 1 Features

- Single DLP controller support for up to WUXGA resolution display using digital micromirror devices (DMDs):
  - Up to 1920x1200 at 120Hz (2D and 3D)
- Provides single 30-bit or dual 60-bit input pixel interface:
  - RGB data format
  - 8.9 or 10 bits per Color
  - Pixel clock up to 320 MHz in dual 30-bit mode on single controller
- High-speed, low voltage differential signaling (LVDS) DMD interface
- 150 MHz ARM946<sup>™</sup> microprocessor
- Microprocessor peripherals
  - Programmable pulse-width modulation (PWM) and capture timers
  - Three I<sup>2</sup>C ports, Three UART ports and three \_ SSP ports
  - One USB 1.1 secondary port
- Image processing
  - Multiple image processing algorithms
  - Frame rate conversion
  - Color coordinate adjustment
  - Programmable color space conversion
  - Programmable degamma and splash
  - Integrated support for 3-D display
  - 2-D keystone correction

- Integrated clock generation circuitry
  - Operates on a single 20 MHz crystal
  - Integrated spread spectrum clocking
- External memory support
  - Parallel flash for microprocessor and PWM sequence
- 516 pin plastic ball grid array package
- Supports LED, and laser hybrid illuminations

#### 2 Applications

- Laser TV
- Smart projector
- **Digital signage**
- Enterprise projectors

## **3 Description**

The DLPC4430 is a digital display controller for the DLP display chipset. The chipset is comprised of DLPC4430 display controller, DLP DMD, DLPA100 controller power management device and DLPA300 -DMD power management device (refer to the DMD data sheet). This solution is a great fit for display systems that require high resolution, high brightness and system simplicity. To ensure reliable operation, the DLPC4430 display controller must always be used with a DLP DMD and respective power management devices.

#### **Device Information**

PART NUMBER <sup>(1)</sup>	PACKAGE	BODY SIZE (NOM)				
DLPC4430	ZPC (516)	27.00 mm × 27.00 mm				

(1) For all available packages, see the orderable addendum at the end of the data sheet.

#### **Simplified Schematic**

#### Table 5-1. Pin Functions

PIN <sup>(1)</sup> I/O <sup>(2)</sup> NAME         NO.		HO(2)	DESCRIPTION			
		· //O(2)	DESCRIPTION			
POSENSE	P22	I <sub>4</sub>	Power-On Sense, High true, signal provided from an external voltage monitor circuit. This signal is driven active (high) when all ASIC supply voltages have reached 90% of their specified minimum voltage. This signal is driven inactive (low) after the falling edge of PWRGOOD as specified.			
PWRGOOD	T26	14	Power Good, High true, signal from external power supply or voltage monitor. A high value indicates all power is within operating voltage specs and the system is safe to exit its reset state. A transition from high to low is used to indicate that the controller or DMD supply voltage drops below their rated minimum level. This transition must occur prior to the supply voltage drop as specified. During this interval, POSENSE must remain active high. This is a warning of an imminent power loss condition. This warning is required to enhance long term DMD reliability. A DMD park followed by a full controller reset is performed by the DLPC4430 controller when PWRGOOD goes low for the specified minimum, protecting the DMD. This minimum de-assertion time is used to protect the input from glitches. Following this the DLPC4430 controller is held in its reset state as long as PWRGOOD is low. PWRGOOD must be driven high for normal operation. The DLPC4430 controller acknowledges PWRGOOD as active once it has been driven high for a specified minimum time. Uses hysteresis.			
EXT_ARTZ	T24	O <sub>2</sub>	General purpose, LOW true, reset output. This output is asserted low immediately upon asserting power-up reset (POSENSE) low and remains low while POSENSE remains low. EXT_ARSTZ continues to be held low after the release of power-up reset (that is, POSENSE set high) until released by software. EXT_ARSTZ is also asserted low approximately 5µs after the detection of a PWRGOOD or any internally generated reset. In all cases it remains active for a minimum of 2ms. Note that the ASIC contains a software register that can be used to independently drive this output.			
MTR_ARTZ	T25	O <sub>2</sub>	Color wheel motor controller, LOW true, reset output. This output is asserted low immediately upon asserting power-up reset (POSENSE) low and remains low while POSENSE remains low. MTR_ARSTZ continues to be held low after the release of power-up reset (i.e. POSENSE set high) until released by software. MTR_ARSTZ is also optionally asserted low approximately 5 µs after the detection of a PWRGOOD or any internally generated reset. In all cases it remains active for a minimum of 2 ms. Note that the ASIC contains a software register that can be used to independently drive this output. The ASIC also contains a software register that can be used to disable the assertion of motor reset upon a lamp strike reset.			
BOARD LEVEL TEST	AND INITIALIZATION	(3)				
TDI	N25	I <sub>4</sub>	JTAG serial data in			
тск	N24	I <sub>4</sub>	JTAG serial data clock			
TMS1	P25	I <sub>4</sub>	JTAG test mode select			
TMS2	P26	I <sub>4</sub>	JTAG test mode select			
TDO1	N23	O <sub>5</sub>	JTAG serial data out			
TDO2	N22	0 <sub>5</sub>	JTAG serial data out			
TRSTZ	M23	I <sub>4</sub>	JTAG reset. This signal includes an internal pull-up and utilizes hysteresis. This pin is pulled high (or left unconnected) when the JTAG interface is in use for boundary scan or ARM debug. Connect this pin to ground otherwise. Failure to tie this pin low during normal operation will cause startup and initialization problems.			
RTCK	E4	0 <sub>2</sub>	JTAG Return Clock			
ETM_PIPESTAT_2	A4	B <sub>2</sub>				
ETM_PIPESTAT_1	B5	B <sub>2</sub>	ETM Trace Port Pipeline Status. Indicates the pipeline status of the ARM core. These signals include internal pull-downs.			
ETM_PIPESTAT_0	C6	B <sub>2</sub>				
ETM_TRACESYNC	A5	B <sub>2</sub>	ETM Trace Port Synchronization signal, indicating the start of a branch sequence on the trace packet port. This signal includes an internal pull-down.			
ETM_TRACECLK	D7	B <sub>2</sub>	ETM Trace Port Clock. This signal includes an internal pull-down.			
ICTSEN	M24	I <sub>4</sub>	IC Tri-State Enable (active high). Asserting high will Tri-state all outputs except the JTAG interface. This signal includes an internal pull-down, however an external pull-down is recommended for added protection. Uses hysteresis.			
TSTPT_7	E8	B <sub>2</sub>	Test pin 7 - This signal provides internal pull-downs. Normal Use: reserved for test output. Recommended to be left open or unconnected for normal use.			
TSTPT_6	B4	B <sub>2</sub>	Test pin 6 - This signal provides internal pull-downs.           Normal Use: reserved for test output. Recommended to be left open or unconnected for normal use.			
TSTPT_5	C4	B <sub>2</sub>	Test pin 5 - This signal provides internal pull-downs. Normal Use: reserved for test output. Recommended to be left open or unconnected for normal use.			
TSTPT_4	E7	B <sub>2</sub>	Test pin 4 - This signal provides internal pull-downs. Normal Use: reserved for test output. Recommended to be left open or unconnected for normal use.			
TSTPT_3	D5	B <sub>2</sub>	Test pin 3 - This signal provides internal pull-downs. Normal Use: reserved for test output. Recommended to be left open or unconnected for normal use.			
TSTPT_2	E6	B <sub>2</sub>	Test pin 2 - This signal provides internal pull-downs. Additionally, it is recommended that jumper options be provided for connecting TSTPT(2:0) to external pull-ups.			
TSTPT_1	D3	B <sub>2</sub>	Test pin 1 - This signal provides internal pull-downs. Additionally, it is recommended that jumper options be provided for connecting TSTPT(2:0) to external pull-ups.			
TSTPT_0	C2	B <sub>2</sub>	Test pin 0 - This signal provides internal pull-downs. Additionally, it is recommended that jumper options be provided for connecting TSTPT(2:0) to external pull-ups.			
DEVICE TEST						
HW_TEST_EN	M25	I <sub>4</sub>	Device manufacturing test enable: This signal includes an internal pull-down and utilizes hysteresis. It is recommended that this signal be tied to an external ground in normal operation for added protection.			
PORT1 and PORT 2 C	HANNEL DATA and	CONTROL (4) (5) (6) (7				

PIN(1)           NAME         NO.						
		- I/O <sup>(2)</sup>	DESCRIPTION			
P_CLK1	AE22	I <sub>4</sub>	Input Port Data Pixel Write Clock (selectable as rising or falling edge triggered, and which port it is associated wit or B or (A and B))). This signal includes an internal pull-down.			
P_CLK2	W25	I <sub>4</sub>	Input Port Data Pixel Write Clock (selectable as rising or falling edge triggered, and which port it is associated with (A or B or (A and B))). This signal includes an internal pull-down.			
P_CLK3	AF23	I <sub>4</sub>	Input Port Data Pixel Write Clock (selectable as rising or falling edge triggered, and which port it is associated with (A or B or (A and B))). This signal includes an internal pull-down.			
P_DATAEN1	AF22	I <sub>4</sub>	Active High Data Enable. Selectable as to which port it is associated with (A or B or (A and B)). This signal includes an internal pull-down.			
P_DATAEN2	W24	I <sub>4</sub>	Active High Data Enable. Selectable as to which port it is associated with (A or B or (A and B)). This signal includes an internal pull-down.			
P1_A_9	AD15	I <sub>4</sub>	Port 1 A Channel Input Pixel Data (bit weight 128)			
P1_A_8	AE15	I <sub>4</sub>	Port 1 A Channel Input Pixel Data (bit weight 64)			
P1_A_7	AE14	I <sub>4</sub>	Port 1 A Channel Input Pixel Data (bit weight 32)			
P1_A_6	AE13	I <sub>4</sub>	Port 1 A Channel Input Pixel Data (bit weight 16)			
P1_A_5	AD13	I <sub>4</sub>	Port 1 A Channel Input Pixel Data (bit weight 8)			
P1_A_4	AC13	I <sub>4</sub>	Port 1 A Channel Input Pixel Data (bit weight 4)			
P1 A 3	AF14	I <sub>4</sub>	Port 1 A Channel Input Pixel Data (bit weight 2)			
	AF13		Port 1 A Channel Input Pixel Data (bit weight 1)			
P1_A_2		I <sub>4</sub>				
P1_A_1	AF12	I <sub>4</sub>	Port 1 A Channel Input Pixel Data (bit weight 0.5)			
P1_A_0	AE12	I <sub>4</sub>	Port 1 A Channel Input Pixel Data (bit weight 0.25)			
P1_B_9	AF18	I <sub>4</sub>	Port 1 B Channel Input Pixel Data (bit weight 128)			
P1_B_8	AB18	I <sub>4</sub>	Port 1 B Channel Input Pixel Data (bit weight 64)			
P1_B_7	AC15	I <sub>4</sub>	Port 1 B Channel Input Pixel Data (bit weight 32)			
P1_B_6	AC16	I <sub>4</sub>	Port 1 B Channel Input Pixel Data (bit weight 16)			
P1_B_5	AD16	I <sub>4</sub>	Port 1 B Channel Input Pixel Data (bit weight 8)			
P1_B_4	AE16	I <sub>4</sub>	Port 1 B Channel Input Pixel Data (bit weight 4)			
P1_B_3	AF16	I <sub>4</sub>	Port 1 B Channel Input Pixel Data (bit weight 2)			
P1_B_2	AF15	I <sub>4</sub>	Port 1 B Channel Input Pixel Data (bit weight 1)			
P1_B_1	AC14	I <sub>4</sub>	Port 1 B Channel Input Pixel Data (bit weight 0.5)			
P1_B_0	AD14	I <sub>4</sub>	Port 1 B Channel Input Pixel Data (bit weight 0.25)			
P1_C_9	AD20	I <sub>4</sub>	Port 1 C Channel Input Pixel Data (bit weight 128)			
P1_C_8	AE20	I <sub>4</sub>	Port 1 C Channel Input Pixel Data (bit weight 64)			
P1_C_7	AE21	I <sub>4</sub>	Port 1 C Channel Input Pixel Data (bit weight 32)			
P1_C_6	AF21	I <sub>4</sub>	Port 1 C Channel Input Pixel Data (bit weight 16)			
	AD19					
P1_C_5		I <sub>4</sub>	Port 1 C Channel Input Pixel Data (bit weight 8)			
P1_C_4	AE19	I <sub>4</sub>	Port 1 C Channel Input Pixel Data (bit weight 4)			
P1_C_3	AF19	I <sub>4</sub>	Port 1 C Channel Input Pixel Data (bit weight 2)			
P1_C_2	AF20	I <sub>4</sub>	Port 1 C Channel Input Pixel Data (bit weight 1)			
P1_C_1	AC19	I <sub>4</sub>	Port 1 C Channel Input Pixel Data (bit weight 0.5)			
P1_C_0	AE19	I <sub>4</sub>	Port 1 C Channel Input Pixel Data (bit weight 0.25)			
P1_VSYNC	AC20	B <sub>2</sub>	Port 1 Vertical Sync. This signal includes an internal pull-down. While intended to be associated with Port 1, it can be programmed for use with Port 2.			
P1_HSYNC	AD21	B <sub>2</sub>	Port 1 Horizontal Sync. This signal includes an internal pull-down. While intended to be associated with Port 1, it can be programmed for use with Port 2.			
P2_A_9	AD26	I <sub>4</sub>	Port 2 A Channel Input Pixel Data (bit weight 128)			
P2_A_8	AD25	I <sub>4</sub>	Port 2 A Channel Input Pixel Data (bit weight 64)			
P2_A_7	AB21	I <sub>4</sub>	Port 2 A Channel Input Pixel Data (bit weight 32)			
P2_A_6	AC22	I <sub>4</sub>	Port 2 A Channel Input Pixel Data (bit weight 16)			
P2_A_5	AD23	I <sub>4</sub>	Port 1 A Channel Input Pixel Data (bit weight 8)			
P2_A_4	AB20	I <sub>4</sub>	Port 2 A Channel Input Pixel Data (bit weight 4)			
 P2_A_3	AC21	I <sub>4</sub>	Port 2 A Channel Input Pixel Data (bit weight 2)

P2_VSYNC	U22	B <sub>2</sub>	Port 2 Vertical Sync. This signal includes an internal pull-down. While intended to be associated with Port 2, it can be programmed for use with Port1.				
P2_HSYNC	W26	B <sub>2</sub>	Port 2 Horizontal Sync. This signal includes an internal pull-down. While intended to be associated with Port 2, it can be programmed for use with Port1.				
ALF INPUT PORT CO	ONTROL						
ALF_VSYNC	AF11	I <sub>4</sub>	Autolock dedicated vertical sync. This signal includes an internal pull-down and uses hysteresis.				
ALF_HSYNC	AD11	I <sub>4</sub>	Autolock dedicated horizontal sync. This signal includes an internal pull-down and uses hysteresis.				
ALF_CSYNC	AE11	I <sub>4</sub>	Autolock dedicated composite sync (sync on green). This signal includes an internal pull-down and uses hysteresis.				
DMD RESET and BIA	AS CONTROL						
DADOEZ	AE7	O <sub>5</sub>	DAD (DLPA200 / DLPA300)Output Enable (active low)				
DADADDR_3	AD6	O <sub>5</sub>					
DADADDR_2	AE5	O <sub>5</sub>					
DADADDR_1	AF4	O <sub>5</sub>	DAD address				
DADADDR_0	AB8	O <sub>5</sub>	—				
DADMODE_1	AD7	O <sub>5</sub>					
DADMODE_0	AE6	O <sub>5</sub>	DAD modes				
DADSEL_1	AE4	O <sub>5</sub>					
DADSEL 0	AC7	O <sub>5</sub>	DAD select				
DADSTRB	AF5	O <sub>5</sub>	DAD strobe				
DAD INTZ	AC8	I <sub>4</sub>	DAD interrupt (active low). This signal typically requires an external pull-up and uses hysteresis.				
DMD LVDS INTERFA	CE						
DCKA P	V4	O <sub>7</sub>					
DCKA N	V3	0 <sub>7</sub>	DMD, LVDS I/F channel A, differential clock				
SCA P	V2	0 <sub>7</sub>					
SCA_N	V1	0 <sub>7</sub>	DMD, LVDS I/F channel A, differential serial control				
DDA P 15	P4	0 <sub>7</sub>	DMD, LVDS I/F channel A, differential serial data				
DDA_N_15	P3	0 <sub>7</sub>	DMD, LVDS I/F channel A, differential serial data				
DDA_P_14	P2	0 <sub>7</sub>	DMD, LVDS I/F channel A, differential serial data				
DDA_P_14 DDA_N_14	P1	0 <sub>7</sub>	DMD, LVDS I/F channel A, differential serial data				
DDA_N_12	R1	0 <sub>7</sub>	DMD, LVDS I/F channel A, differential serial data				
DDA_N_12 DDA_P_11	T4	0 <sub>7</sub>					
DDA_P_11 DDA_N_11	T3	0 <sub>7</sub>	DMD, LVDS I/F channel A, differential serial data				
DDA_P_10	T2	0 <sub>7</sub>	DMD, LVDS I/F channel A, differential serial data				
	T1	0 <sub>7</sub>	DMD, LVDS I/F channel A, differential serial data				
DDA_N_10	U4		DMD, LVDS I/F channel A, differential serial data				
DDA_P_9	U4 U3	0 <sub>7</sub>	DMD, LVDS I/F channel A, differential serial data				
DDA_N_9		0 <sub>7</sub>	DMD, LVDS I/F channel A, differential serial data				
DDA_P_8	U2	07	DMD, LVDS I/F channel A, differential serial data				
DDA_N_8	U1	O <sub>7</sub>	DMD, LVDS I/F channel A, differential serial data				

PIN <sup>(1)</sup>

L-VDQPAD_[7:0], R- VDQPAD_[7:0]	B18, D18, B17, E17, A18, C18, A17, D17, AE17, AC17, AF17, AC18, AB16, AD17, AB17, AD18	RESERVED	These pins have to be tied directly to ground for normal operation.			
CFO_VDD33	AE26	RESERVED	This pin has to be tied directly to 3.3 I/O power (VDD33) for normal operation.			
VTEST1, VTEST2, VTEST3, VTEST4	AB14, AB15, E15, E16	RESERVED	These pins have to be tied directly to ground for normal operation.			
LVDS_AVS1, LVDS_AVS2	V5, K5	POWER	These pins have to be tied directly to ground for normal operation.			
VPGM	AC6	POWER	This pin has to be tied directly to ground for normal operation.			
GROUND	A26, A25, A24, B25, C24, D23, E22, F21, F18, F15, F12, F9, F6, E5, D4, C3, B3, A3, B2, A2, B1, A1 G5, J5, J6, L5, M6, N5, R5, R6, U5, V6, W5, Y5, AA6, AB5, AC4, AD3, AE3, AF3, AF2, AF1, AA9, AA12, AA15, AA18, AA21, AB22, AC23, AD24, AE24, AF24, AE25, AF26, AF26, V21, M21, J21, L15, L14, L13, L12, M16, M15, N14, M13, M12, M12, M11, N16, N15, N14, N13, N12, N11, P16, P15, P14, P13, P12, P11, R16, R15, R14, R13, R12, R11, T15, T14, T13, T12	GROUND	Common ground			

(1)

For instructions on handling unused pins, see *General Handling Guidelines for Unused CMOS-Type Pins*. I/O Type: I = Input, O = Output, B = Bidirectional, and H = Hysteresis. See Table 5-2 for subscript explanation. (2)

(3) All JTAG signals are LVTTL compatible.

- (4) Ports 1 and 2 can each be used to support multiple source options for a given product (for example AFE and HDMI). To do so, the data bus from both source components must be connected to the same port pins (1 or 2) and control given to the DLPC4430 device to tri-state the "inactive" source. Tying them together like this causes some signal degradation due to reflections on the tri-stated path. Given the clock is the most critical signal, three Port clocks (1,2,and 3) are provided to provide an option to improve the signal integrity.
- (5) Ports 1 and 2 can be used separately as two 30-bit ports, or can be combined into one 60-bit port (typically for high data rate sources) for transmission of two pixels per clock.
- (6) The A, B, C input data channels of Ports 1 and 2 can be internally re-configured/ re-mapped for optimum board layout.
- (7) Sources feeding less than the full 10-bits per color component channel have to be MSB justified when connected to the DLPC4430 controller and the LSBs tied off to zero. For example an 8-bit per color input has to be connected to bits 9:2 of the corresponding A, B, C input channel.
- (8) GPIO signals must be configured by software for input, output, bidirectional, or open-drain. Some GPIOs have one or more alternate use modes, which are also software configurable. The reset default for all optional GPIOs is as an input signal. However, any alternate function connected to these GPIO pins with the exception of general-purpose clocks and PWM generation, are reset. An external pullup to the 3.3V supply is required for each signal configured as open-drain. External pullup or pulldown resistors may be required to ensure stable operation before software is able to configure these ports.

#### Table 5-2. I/O Type Subscript Definition

SUBSCRIPT	DESCRIPTION	ESD STRUCTURE
2	3.3V LVTTL I/O Buffer with 8mA drive	
3	3.3V LVTTL I/O Buffer, with 12mA drive	
4	3.3V LVTTL Receiver	
5	3.3V LVTTL I/O Buffer with 8 mA drive, with Slew Rate Control	
6	3.3V LVTTL I/O Buffer, with programmable 4mA, 8mA, or 12mA drive	ESD diode to VDD33 and GROUND
7	1.8V LVDS (DMD I/F)	
8	3.3V I2C with 3 mA sink	
9	USB Compatible (3.3V)	
10	OSC 3.3V I/O Compatible LVTTL	

## 6 Specifications

## 6.1 Absolute Maximum Ratings

over operating free-air temperature range	$(unless otherwise noted)^{(1)}$

		MIN	MAX	UNIT

T <sub>J</sub> Operating Junction ten	nperature	0	111	°C
T <sub>stg</sub> Storage temperature	range	-40	125	°C

(1) Stresses beyond those listed under Absolute Maximum Ratings may cause permanent damage to the device. These are stress ratings only, which do not imply functional operation of the device at these or any other conditions beyond those indicated under Recommended Operating Conditions. Exposure to absolute-maximum-rated conditions for extended periods may affect device reliability.

(2) All voltage values are with respect to GROUND.

(3) Applies to external input and bidirectional buffers.

## 6.2 ESD Ratings

			VALUE	UNIT
	Human body model (HBM), per ANSI/ESDA/JEDEC JS-001, all pins <sup>(1)</sup>	± 1000	V	
V <sub>(ESD)</sub>	Electrostatic discharge	Charged device model (CDM), per JEDEC specification JESD22-C101, all pins <sup>(2)</sup>	+500/-300	V

(1) Level listed above is the passing level per ANSI, ESDA, and JEDEC JS-001. JEDEC document JEP155 states that 500V HBM allows safe manufacturing with a standard ESD control process.

(2) Level listed above is the passing level per EIA-JEDEC JESD22-C101. JEDEC document JEP157 states that 250V CDM allows safe manufacturing with a standard ESD control process.

## 6.3 Recommended Operating Conditions

over operating free-air temperature range (unless otherwise noted)

		I/O <sup>(1)</sup>	MIN	NOM	MAX	UNIT	
ELECTRICAL				l l			
V <sub>DD33</sub>	3.3V Supply voltage, I/O		3.135	3.3	3.465	V

T <sub>C</sub>	Operating top center case temperature	See <sup>(3) (4)</sup>	0		109.16	°C	
TJ	Operating junction temperature		0		111	°C	

(1) The number inside each parenthesis for the I/O refers to the type defined in the I/O type subscript definition section.

(2) Assumes minimum 1 m/s airflow along with the JEDEC thermal resistance and associated conditions listed at www.ti.com/packaging. Thus this is an approximate value that varies with environment and PCB design.

(3) Maximum thermal values assume max power of 4.6 watts.

(4) Assume Psi<sub>JT</sub>equals 0.4 C/W.

#### **6.4 Thermal Information**

		DLPC4430	
	THERMAL METRIC <sup>(1)</sup>	ZPC (BGA)	UNIT
		516 PINS	
R <sub>θJA</sub>	Junction-to-ambient thermal resistance <sup>(2)</sup>	14.4	°C/W
$R_{\theta JC}$	Junction-to-case thermal resistance	4.4	°C/W

(1) For more information about traditional and new thermal metrics, see the Semiconductor and IC Package Thermal Metrics Application Report, SPRA953.

(2) In still air.

## 6.6 System Oscillators Timing Requirements

over operating free-air temperature range(unless otherwise noted)

PARAM	ETER	TEST CONDITIONS	MIN	MAX	UNIT				
SYSTEM	SYSTEM OSCILLATORS								
f <sub>clock</sub>	Clock frequency, MOSC <sup>(1)</sup>		19.998	20.002	MHz				
t <sub>c</sub>	Cycle time, MOSC <sup>(1)</sup>		49.995	50.005	MHz				
t <sub>w(H)</sub>	Pulse duration <sup>(2)</sup> , MOSC, high	50% to 50% reference points (signal)	20		ns				
t <sub>w(L)</sub>	Pulse duration <sup>(2)</sup> , MOSC, low	50% to 50% reference points (signal)	20		ns				
t <sub>t</sub>	Transition time <sup>(2)</sup> , MOSC, tt = tf /tr	20% to 80% reference points (signal)		12	ns				
t <sub>jp</sub>	Period Jitter <sup>(2)</sup> , MOSC (This is the deviation in period from the ideal period due solely to high frequency jitter).			18	ps				

(1) The frequency range for MOSC is 20 MHz with +/-100 PPM accuracy (it includes impact to accuracy due to aging, temperature and trim sensitivity). The MOSC input cannot support spread spectrum clock spreading.

(2) Applies only when driven via an external digital oscillator.

#### 6.7 Test and Reset Timing Requirements

			MIN	MAX	UNIT
t <sub>W1(L)</sub>	Pulse duration, inactive low, PWRGOOD	50% to 50% reference points (signal)	4.0		μs
t <sub>W1(L)</sub>	Pulse duration, inactive low, PWRGOOD	50% to 50% reference points (signal)		1000 <sup>(2)</sup>	ms
t <sub>t1</sub>	Transition time, PWRGOOD, t <sub>t1</sub> = t <sub>f</sub> /t <sub>r</sub>	20% to 80% reference points (signal)		625	μs
t <sub>W2(L)</sub>	Pulse duration, inactive low, POSENSE	50% to 50% reference points (signal)	500		μs
t <sub>W2(L)</sub>	Pulse duration, inactive low, POSENSE	50% to 50% reference points (signal)		1000 <sup>(2)</sup>	ms
t <sub>t2</sub>	Transition time, POSENSE, t <sub>t1</sub> = t <sub>f</sub> /t <sub>r</sub>	20% to 80% reference points (signal)		25 <sup>(1)</sup>	μs
t <sub>PH</sub>	Power Hold time, POSENSE remains active after PWRGOOD is de-asserted	20% to 80% reference points (signal)	500		μs
t <sub>EW</sub>	Early Warning time, PWRGOOD goes inactive low prior to any power supply voltage going below its specification		500		μs
t <sub>W1(L)</sub> +t <sub>W2(L)</sub>	The sum of PWRGOOD and POSENSE inactive time			1050 <sup>(2)</sup>	ms

(1) As long as noise on this signal is below the hysteresis threshold.

(2) With 1.8 V power applied. If the 1.8 V power is disabled by the controller command (For example – if system is placed in Low Power mode where the controller disables 1.8 V power), these signals can be placed and remain in their inactive state indefinitely.

## 6.8 JTAG Interface: I/O Boundary Scan Application Timing Requirements

			MIN	MAX	UNIT
f <sub>clock</sub>	Clock frequency, TCK			10	MHZ
t <sub>C</sub>	Cycle time, TCK		100		ns
t <sub>W(H)</sub>	Pulse duration, high	50% to 50% reference points (signal)	40		ns
t <sub>W(L)</sub>	Pulse duration, low	50% to 50% reference points (signal)	40		ns
t <sub>t</sub>	Transition time, $t_t = t_f/t_r$	20% to 80% reference points (signal)		5	ns
t <sub>SU</sub>	Setup time, TDI valid before TCK↑		8		ns
t <sub>h</sub>	Hold time, TDI valid after TCK↑		2		ns
t <sub>SU</sub>	Setup time, TMS1 valid before TCK↑		8		ns
t <sub>h</sub>	Hold time, TMS1 valid before TCK↑		2		ns

## 6.9 Port 1 Input Pixel Timing Requirements

		TEST CONDITIONS	MIN	MAX	UNIT

t <sub>w(A)</sub>	HSYNC Active Pulse Width		16		Pixel Clocks

(1)

ALF\_CSYNC, ALF\_VSYNC and ALF\_HSYNC are Asynchronous signals. For frequencies (fclock) less than 175 MHZ, use following formula to obtain the jitter: Max Clock Jitter = +/- [  $(1/f_{clock}) - 5414 \text{ ps}$ ] (2)

## 6.10 Port 3 Input Pixel Interface (via GPIO) Timing Requirements

	PARAMETER	TEST CONDITIONS	MIN	MAX	UNIT
f <sub>clock</sub>	Clock Frequency, P3_CLK		27	54	MHz
t <sub>c</sub>	Cycle time, P3_CLK		18.5	37.1	ns
t <sub>W(H)</sub>	Pulse Duration, high	50% to 50% reference points (signal)	7.4		ns
t <sub>W(L)</sub>	Pulse Duration, low	50% to 50% reference points (signal)	7.4		ns
t <sub>jp</sub>	Clock period jitter, P3_CLK	Max f <sub>clock</sub>	See (1)	See <sup>(1)</sup>	ps
t <sub>t</sub>	Transition time, $t_t = t_f / t_r$ , P3_CLK	20% to 80% reference points (signal)	1.0	5.0	ns
t <sub>t</sub>	Transition time, $t_t = t_f/t_r$ , P3_DATA(9-0)	20% to 80% reference points (signal)	1.0	5.0	ns
t <sub>su</sub>	Setup time, P3_DATA(9-0) valid before P3_CLK↑↓		2.0		ns
t <sub>h</sub>	Hold time, P3_DATA(9-0) valid after P3_CLK↑↓		2.0		ns

(1) For frequencies less than 54 MHZ, use following formula to obtain the jitter: Jitter = [(1/F) - 5414 ps].

## 6.11 DMD LVDS Interface Timing Requirements

		FROM (INPUT)	TO (OUTPUT)	MIN	MAX	UNIT
f <sub>clock</sub>	Clock frequency, DCK_A	N/A	DCK_A	100	400	MHz
t <sub>C</sub>	Cycle time, DCK_A <sup>(1)</sup>	N/A	DCK_A	2475.3		ps
t <sub>W(H)</sub>	Pulse duration, high	N/A	DCK_A	1093		ps
t <sub>W(L)</sub>	Pulse duration, low	N/A	DCK_A	1093		ps
t <sub>t</sub>	Transition time, t <sub>t</sub> = t <sub>f</sub> /t <sub>r</sub>	N/A	DCK_A	100	400	ps
t <sub>osu</sub>	Output Setup time at max clock rate <sup>(2)</sup>	DCK_A↑↓	SCA, DDA(15:0)	438		ps
t <sub>oh</sub>	Output hold time at max clock rate <sup>(2)</sup>	DCK_A↑↓	SCA, DDA(15:0)	438		ps
f <sub>clock</sub>	Clock frequency, DCK_B	N/A	DCK_B	100	400	MHz
t <sub>C</sub>	Cycle time, DCK_B <sup>(1)</sup>	N/A	DCK_B	2475.3		ps
t <sub>W(H)</sub>	Pulse duration, high	N/A	DCK_B	1093		ps
t <sub>W(L)</sub>	Pulse duration, low	N/A	DCK_B	1093		ps
t <sub>t</sub>	Transition time, t <sub>t</sub> = t <sub>f</sub> /t <sub>r</sub>	N/A	DCK_B	100	400	ps
t <sub>osu</sub>	Output Setup time at max clock rate <sup>(2)</sup>	DCK_B↑↓	SCA, DDB(15:0)	438		ps
t <sub>oh</sub>	Output hold time at max clock rate <sup>(2)</sup>	DCK_B↑↓	SCA, DDB(15:0)	438		ps
t <sub>sk</sub>	Output Skew, Channel A to Channel B	DCK_A↑	DCK_B↑		250	ps

(1) The minimum cycle time (t<sub>c</sub>) for DCK\_A and DCL\_B includes 1.0% spread spectrum modulation. User must verify that DMD can support this rate.

(2) Output Setup and Hold times for DMD clock frequencies below the maximum can be calculated as follows:  $t_{osu}(fclock) = t_{osu}(fmax) + 250000^{*}(1/fclock - 1/400)$  and  $t_{oh}(fclock) = t_{oh}(fmax) + 250000^{*}(1/fclock - 1/400)$  where fclock is in MHz.

#### 6.12 Synchronous Serial Port (SSP) Interface Timing Requirements

	PARAMETER	TEST CONDITIONS	MIN	MAX	UNIT
SSP P	rimary	I		I	
t <sub>su</sub>	Setup time, SSPx_DI valid before SSPx_CLK		15		ns
t <sub>su</sub>	Setup time, SSPx_DI valid before SSPx_CLK		15		ns
t <sub>h</sub>	Hold time, SSPx_DI valid after SSPx_CLK		0		ns
t <sub>h</sub>	Hold time, SSPx_DI valid after SSPx_CLK		0		ns
t <sub>t</sub>	Transition time, SSPx_DI, $t_t = t_f/t_r$	20% to 80% reference points (signal)		1.5	ns
SSP S	econdary				
t <sub>su</sub>	Setup time, SSPx_DI valid before SSPx_CLK		12		ns
t <sub>su</sub>	Setup time, SSPx_DI valid before SSPx_CLK		12		ns
t <sub>h</sub>	Hold time, SSPx_DI valid after SSPx_CLK		12		ns
t <sub>h</sub>	Hold time, SSPx_DI valid after SSPx_CLK		12		ns
t <sub>t</sub>	Transition time, SSPx_DI, $t_t = t_f/t_r$	20% to 80% reference points (signal)		1.5	ns

## 6.13 Programmable Output Clocks Switching Characteristics

over operating free air temperature range,  $C_L(min timing) = 5 \text{ pF}$ ,  $C_L(max timing) = 50 \text{ pF}$  (unless otherwise noted)

	PARAMETER	TEST CONDITIONS	TO (OUTPUT)	MIN	MAX	UNIT
f <sub>clock</sub>	Clock frequency, OCLKA <sup>(1)</sup>		OCLKA	0.787	50	MHz
t <sub>C</sub>	Cycle Time, OCLKA		OCLKA	20	1270.6	ns
t <sub>W(H)</sub>	Pulse Duration, high <sup>(2)</sup>	50% to 50% reference points (signal)	OCLKA	(t <sub>C</sub> /22)		ns
t <sub>W(L)</sub>	Pulse Duration, low <sup>(2)</sup>	50% to 50% reference points (signal)	OCLKA	(t <sub>C</sub> /22)		ns
	Jitter		OCLKA		350	ps
f <sub>clock</sub>	Clock frequency, OCLKB <sup>(1)</sup>		OCLKB	0.787	50	MHz
t <sub>C</sub>	Cycle Time, OCLKB		OCLKB	20	1270.6	ns
t <sub>W(H)</sub>	Pulse Duration, high <sup>(2)</sup>	50% to 50% reference points (signal)	OCLKB	(t <sub>C</sub> /22)		ns
t <sub>W(L)</sub>	Pulse Duration, low <sup>(2)</sup>	50% to 50% reference points (signal)	OCLKB	(t <sub>C</sub> /22)		ns
	Jitter		OCLKB		350	ps
f <sub>clock</sub>	Clock frequency, OCLKC <sup>(1)</sup>		OCLKC	0.787	50	MHz
t <sub>C</sub>	Cycle Time, OCLKC <sup>(2)</sup>		OCLKC	20	1270.6	ns
t <sub>W(H)</sub>	Pulse Duration, high	50% to 50% reference points (signal)	OCLKC	(t <sub>C</sub> /22)		ns
t <sub>W(L)</sub>	Pulse Duration, low <sup>(2)</sup>	50% to 50% reference points (signal)	OCLKC	(t <sub>C</sub> /22)		ns
	Jitter		OCLKC		350	ps

(1) The frequency of OCLKA thru OCLKC is programmable.

(2) The Duty Cycle of OCLKA thru OCLKC is within +/- 2 ns of 50%.

## 6.14 Synchronous Serial Port Interface (SSP) Switching Characteristics

over operating free-air temperature range,  $C_L(min timing) = 5 \text{ pF}$ ,  $C_L(max timing) = 50 \text{ pF}$  (unless otherwise noted)

	PARAMETER	TEST CONDITIONS	FROM (INPUT)	TO (OUTPUT)	MIN	MAX	UNIT
f <sub>clock</sub>	Clock Frequency, SSPx_CLK		N/A	SSPx_CLK	73	25000	kHz
t <sub>c</sub>	Cycle time, SSPx_CLK		N/A	SSPx_CLK	0.040	13.6	μs
t <sub>W(H)</sub>	Pulse Duration, high	50% to 50% reference points (signal)	N/A	SSPx_CLK	40%		
t <sub>W(L)</sub>	Pulse Duration, low	50% to 50% reference points (signal)	N/A	SSPx_CLK	40%		
SSP P	rimary <sup>(1)</sup>			1		1	
t <sub>pd</sub>	Output Propagation, Clock to Q, SSPx_DO <sup>(2)</sup>		SSPx_CLK↓	SSPx_DO	-5	5	ns
t <sub>pd</sub>	Output Propagation, Clock to Q, SSPx_DO <sup>(2)</sup>		SSPx_CLK↑	SSPx_DO	-5	5	ns
SSP S	econdary <sup>(1)</sup>		1			1	
t <sub>pd</sub>	Output Propagation, Clock to Q, SSPx_DO <sup>(2)</sup>		SSPx_CLK↓	SSPx_DO	0	34	ns
t <sub>pd</sub>	Output Propagation, Clock to Q, SSPx_DO <sup>(2)</sup>		SSPx_CLK↑	SSPx_DO	0	34	ns

(1) The SSP can be used as an SSP Primary, or as an SSP Secondary. When used as a Primary, the SSP can be configured to sample DI with the same internal clock edge used to transmit the next DO, which provides a full cycle rather than a half cycle timing path, allowing operation at higher SPI clock frequencies.

(2) The SSP can be configured into four different operational modes/configurations.

Table 6-1. SSP Clock Operational Modes							
SPI Clocking Mode         SPI Clock Polarity (CPOL)         SPI Clock Phase (CPHA)							
0	0	0					
1	0	1					
2	1	0					
3	1	1					

. . . .

## 6.15 JTAG Interface: I/O Boundary Scan Application Switching Characteristics

over operating free-air temperature range,  $C_1$  (min timing) = 5 pF,  $C_1$  (max timing) = 85 pF (unless otherwise noted)

## 7 Detailed Description

## 7.1 Overview

As with prior DLP® electronics solutions, image data is 100% digital from the DLPC4430 input port to the image projected on to the display screen. The image stays in digital form and is never converted into an analog signal. The DLPC4430 processes the digital input image and converts the data into bit-plane format as needed by the DMD. The DLPC4430 display controller is optimized for high-resolution and high-brightness display applications. Applications include Home Theatre, Smart Display, Digital Signage, and Laser TV.

## 7.2 Functional Block Diagram

Figure 7-1. Functional Block Diagram

## 7.3 Feature Description

## 7.3.1 System Reset Operation

## 7.3.1.1 Power-up Reset Operation

Immediately following a power-up event, DLPC4430 hardware automatically brings up the Primary PLL and places the controller in normal power mode, then the hardware follows the standard system reset procedure (see *Section 7.3.1.2*).

#### 7.3.1.2 System Reset Operation

Immediately following any type of system reset (Power-up reset, PWRGOOD reset, watchdog timer timeout, lamp-strike reset), the DLPC4430 device automatically returns to NORMAL power mode in the following state:

- All GPIO are tri-stated.
- The Primary PLL remains active (it is reset only after a power-up reset sequence) and most of the derived clocks are active. However, only those resets associated with the ARM9 processor and its peripherals are released (the ARM9 is responsible for releasing all other resets).
- ARM9 associated clocks default to their full clock rates. (Boot-up is a full speed)
- All front end clocks derived are disabled.

- The PLL feeding the LVDS DMD I/F (PLLD) defaults to its power-down mode and all derived clocks are inactive with corresponding resets asserted (The ARM9 is responsible for enabling these clocks and releasing associated resets).
- LVDS I/O defaults to its power-down mode with outputs tri-stated.
- All resets output by the DLPC4430 device remain asserted until released by the ARM9. (after boot-up)
- The ARM9 processor boots-up from external flash.

When the ARM9 boots-up, the ARM9 API:

- Configures the programmable DDR Clock Generator (DCG) clock rates (i.e. the DMD LVDS I/F rate)
- Enables the DCG PLL (PLLD) while holding divider logic in reset
- When the DCG PLL locks, ARM9 software sets DMD clock rates
- API software then releases DCG divider logic resets, which in turn, enable all derived DCG clocks
- Release external resets

Application software then typically waits for a wake-up command (through the soft power switch on the projector) from the end user. When the projector is requested to wake-up, the software places the ASIC back in normal mode, re-initialize clocks, and resets as required.

#### 7.3.2 Spread Spectrum Clock Generator Support

The DLPC4430 controller supports limited, internally-controlled, spread spectrum clock spreading on the DMD interface. The purpose of this is to frequency spread all signals on this high-speed, external interface to reduce EMI emissions. Clock spreading is limited to triangular waveforms. The DLPC4430 controller provides modulation options of 0%, +/-0.5% and +/-1.0% (center-spread modulation).

#### 7.3.3 GPIO Interface

The DLPC4430 controller provides 83 software-programmable, general-purpose I/O pins. Each GPIO pin is individually configurable as either input or output. In addition, each GPIO output can be either configured as push-pull or open-drain. Some GPIO have one or more alternate-use modes, which are also software configurable. The reset default for all GPIO is as an input signal. However, any alternate function connected to these GPIO pins, with the exception of general purpose clocks and PWM generation, stay in reset. When configured as open-drain, the outputs must be externally pulled-up (to the 3.3V supply). External pull-up or pull-down resistors may be required to ensure stable operation before software is able to configure these ports.

#### 7.3.4 Source Input Blanking

Vertical and horizontal blanking requirements for both input ports are defined as follows (See *Video Timing Parameter Definitions*).

- Minimum port 1 and port 2 vertical blanking
  - Vertical back porch (VBP): 370 µs
  - Vertical front porch (VFP): 1 line
  - Total vertical blanking (TVB): 370 μs + 2 lines
- Minimum port1 and port 2 horizontal blanking
  - Horizontal back porch (HBP): 10 pixels
  - Horizontal front porch (HFP): 0 pixels
  - Total horizontal blanking (THB): 80 pixels

#### 7.3.5 Video Graphics Processing Delay

The DLPC4430 controller introduces a variable number of field/ frame delays dependent on the source type and selected processing steps performed on the source. For optimum audio/ video synchronization this delay must be matched in the audio path. The following tables define various video delay scenarios to aid in audio matching.

Frame and Fields in table refer to source frames and fields.

- For 2-D sources, "N" is defined to be the ratio of the primary channel source frame rate (or field rate for interlaced video) to the display frame/ field rate.
- For 3-D sources, "M" is defined to be the ratio of the primary channel source frame rate (or field rate for interlaced video) required to obtain both the left and right image, to the display frame/field rate (The rate at which each eye is displayed).

Table 7-1. Filling Chainer video-Graphics Frocessing Delay							
Source	Frame Rate Conversion	FRC Type	Formatter Buffer	Total Delay			
48 Hz Graphics	1 Frame	Sync (1:1)	N Frames	1 + N Frames			
50 Hz Graphics	1 Frame	Sync (1:1)	N Frames	1 + N Frames			
60 Hz Graphics	1 Frame	Sync (1:1)	N Frames	1 + N Frames			
100 and 120 Hz Graphics	1 Frame	Sync (1:1)	N Frames	1 + N Frames			
100 and 120 Hz Graphics (3D)	1 Frame	Sync (1:2)	M Frames	1 + M Frames			

 Table 7-1. Primary Channel/Video-Graphics Processing Delay

### 7.3.6 Program Memory Flash/SRAM Interface

The DLPC4430 controller provides three external program memory chip selects:

- PM\_CSZ\_0 available for optional SRAM or flash device (≤ 128 Mb)
- PM\_CSZ\_1 dedicated CS for boot flash device (ie. Standard NOR-type flash, ≤ 128 Mb)
- PM\_CSZ\_2 available for optional SRAM or flash device (≤ 128 Mb)

Flash and SRAM access timing is software programmable up to 31 wait states. Wait state resolution is 6.7 ns in normal mode and 53.33 ns in low power modes. Wait state program values for typical flash access times are shown in the Table 7-2.

Table 7-2. Wait State	<b>Program Value</b>	s for Typical Flash	n Access Times
	i logiani valuo		

	Normal Mode <sup>(1)</sup>	Low Power Mode <sup>(1)</sup>
Formula to Calculate the Required Wait State Value	= Roundup (Device_Access_Time / 6.7 ns)	= Roundup (Device_Access_Time / 53.33 ns)
Max Supported Device Access Time	207 ns	1660 ns

(1) Assumes a maximum single direction trace length of 75 mm.

Note that when another device such as an SRAM or additional flash is used in conjunction with the boot flash, care must be taken to keep stub length short and located as close as possible to the flash end of the route.

The DLPC4430 controller provides enough Program Memory Address pins to support a flash or SRAM device up to 128 Mb. For systems not requiring this capacity, up to two address pins can be used as GPIO instead. Specifically, the two most significant address bits (i.e. PM\_ADDR\_22 and PM\_ADDR\_21) are shared on pins GPIO\_36 and GPIO\_35 respectively. Like other GPIO pins, these pins float in a high-impedance input state following reset; therefore, if these GPIO pins are to be reconfigured as Program Memory Address pins, they require board-level pull-down resistors to prevent any flash address bits from floating until software is able to reconfigure the pins from GPIO to Program Memory Address, upper portions of flash memory are not accessible.

Table 7-3 shows typical GPIO\_35 and GPIO36 pin configuration for various flash sizes.

Table 7-3. Typical GPIO_35 and GPIO	_36 Pin Configurations for Various Flash Sizes
-------------------------------------	--

FLASH SIZE	GPIO_36 Pin Configuration	GPIO_35 Pin Configuration
32 Mb or less	GPIO_36	GPIO_35
64 Mb	GPIO_36	PM_ADDR_21 <sup>(1)</sup>
128 Mb	PM_ADDR_22 <sup>(1)</sup>	PM_ADDR_21 <sup>(1)</sup>

(1) Board-level pulldown resistor required.

#### 7.3.7 Calibration and Debug Support

The DLPC4430 controller contains a test point output port, TSTPT\_(7:0), which provides selected system calibration support as well as ASIC debug support. These test points are inputs while reset is applied and switch to outputs when reset is released. The state of these signals is sampled upon the release of system reset and the captured value configures the test mode until the next time reset is applied. Each test point includes an internal pull-down resistor and thus external pull-ups are used to modify the default test configuration. The default configuration (x00) corresponds to the TSTPT\_(7:0) outputs being driven low for reduce switching activity

during normal operation. For maximum flexibility, an option to jumper to an external pull-up is recommended for TSTPT\_(3:0). Note that adding pull-up to TSTPT\_(7:4) may have adverse affects for normal operation and are not recommended. Note that these external pull-ups are only sampled upon a zero to one transition on POSENSE and thus changing their configuration after reset has been released does not have any effect until the next time reset is asserted and released. Table 7-4 defines the test mode selection for 3 of the 16 programmable scenarios defined by TSTPT\_(3:0):

	No Switching Activity	System Calibration	ARM Debug Signal Set
TSTPT(3:0) Capture Value	x0	x8	x1
TSTPT(0)	0	Vertical Sync	ARM9_Debug (0)
TSTPT(1)	0	Delayed CW Index	ARM9_Debug (1)
TSTPT(2)	0	Sequence Index	ARM9_Debug (2)
TSTPT(3)	0	CW Spoke Test Pt	ARM9_Debug (3)
TSTPT(4)	0	CW Revolution Test Pt	ARM9_Debug (4)
TSTPT(5)	0	Reset Seq. Aux Bit 0	ARM9_Debug (5)
TSTPT(6)	0	Reset Seq. Aux Bit 1	ARM9_Debug (6)
TSTPT(7)	0	Reset Seq. Aux Bit 2	ARM9_Debug (7)

Table	7-4	Test	Mode	Selection
Iable	/	ICOL	NIUUE	Jelection

#### 7.3.8 Board Level Test Support

The in-circuit tri-state enable signal (ICTSEN) is a board level test control signal. By driving ICTSEN to a logic high state, all controller outputs (except TDO1 and TDO2) are tri-stated.

The DLPC4430 controller also provides JTAG boundary scan support on all I/O except non-digital I/O and a few special signals. Table 7-5 defines these exceptions.

Signal Name	PKG Ball		
HW_TEST_EN	M25		
MOSC	M26		
MOSCN	N26		
USB_DAT_N	C5		
USB_DAT_P	D6		
ТСК	N24		
TDI	N25		
TRSTZ	M23		
TDO1	N23		
TDO2	N22		
TMS1	P25		
TMS2	P26		

## Table 7-5. DLPC4430- Signals Not Covered by JTAG

#### 7.4 Device Functional Modes

The DLPC4430 has two functional modes which are enabled via software command via the Host control interface. These modes are Standby and Active.

#### 7.4.1 Standby Mode

The system is powered up and active, however, some blocks within the controller have been shut down to conserve power. Only the  $\mu$ Processor and its peripherals are active (supporting a dormant projector waiting to be woken up). In this mode the DMD is parked and no image can be displayed.

#### 7.4.2 Active Mode

The system is powered up and fully operational, capable of projecting internal or external video sources.

#### 7.4.2.1 Normal Configuration

This configuration enables the full functionality of the DLPC4430.

## 8 Application and Implementation

#### Note

Information in the following applications sections is not part of the TI component specification, and TI does not warrant its accuracy or completeness. TI's customers are responsible for determining suitability of components for their purposes, as well as validating and testing their design implementation to confirm system functionality.

#### 8.1 Application Information

The DLPC4430 display controller coupled with supported DMDs comprise the chipset. The controller integrates all system image processing, DMD control and data formatting onto a single integrated circuit (IC), as well as LED or LPCW illumination systems and multiple image processing algorithms. Applications include Home Theatre, Smart Display, Digital Signage, and Laser TV.

#### **8.2 Typical Application**

The DLPC4430 controller is ideal for applications requiring high brightness and high resolution displays. When one DLPC4430 display controller is combined with the DLP DMD, a power management and motor driver device (DLPA100), and other electrical, optical and mechanical components the chipset enables bright, affordable, high resolution display solutions. A typical DLP system application using the DLPC4430 controller and supported DLP DMD is shown below.

Figure 8-1. Typical LED Display Application

Figure 8-2. Typical LPCW Display Application

#### 8.2.1 Design Requirements

The display controller is the digital interface between the DMD and the rest of the system. The display controller takes digital input from front end digital receivers and drives the DMD over a high speed interface. The display controller also generates the necessary signals (data, protocols, timings) required to display images on the DMD. Some systems require a dual controller to format the incoming data before sending it to the DMD. Reliable operation of the DMD is only insured when the DMD and the controller are used together in a system. In addition to the DLP devices included in the chipset, other devices may be needed such as a flash part to store the software and firmware.

#### 8.2.1.1 Recommended MOSC Crystal Oscillator Configuration

Table 8-1. Crystal Port Characteristics			
PARAMETER	NOMINAL	UNIT	
MOSC TO GROUND Capacitance	1.5	pF	
MOSCZ TO GROUND Capacitance	1.5	pF	

Table 8-2. Recommended Crystal Configuration			
PARAMETER	RECOMMENDED	UNIT	
Crystal circuit configuration	Parallel resonant		
Crystal type	Fundamental (1st Harmonic)		
Crystal nominal frequency	20	MHz	
Crystal frequency temperature stability	+/- 30	PPM	
Overall crystal frequency tolerance (including accuracy, stability, aging, and trim sensitivity)	+/- 100	PPM	
Crystal Equivalent Series Resistor (ESR)	50 max	Ω	
Crystal load	20	pF	
Crystal shunt load	7 max	pF	
RS drive resistor (nominal)	100	Ω	
RFB feedback resistor (nominal)	1	ΜΩ

#### Figure 8-3. Recommended Crystal Oscillator Configuration

Typically the external crystal oscillator stabilizes within 50 ms after stable power is applied.

#### 8.2.2 Detailed Design Procedure

For connecting the DLPC4430 controller and the DLP DMD together, see the reference design schematic. The layout guidelines must be followed to achieve a reliable system. To complete the DLP system, an optical module or light engine is required that contains the DLP DMD, associated illumination sources, optical elements, and necessary mechanical components.

## 9 Power Supply Recommendations

## 9.1 System Power Regulations

It is strongly recommended that the VDD18\_PLLD, VDD18\_PLLM1, and VDD18\_PLLM2 power feeding internal PLLs be derived from an isolated linear regulator in order to minimize the AC Noise component. The VDD11\_PLLD, VDD11\_PLLM1, VDD11\_PLLM2, and VDD11\_PLLS can be derived from the same regulator as the core VDD11, but they have to be filtered.

### 9.2 System Power-Up Sequence

Although the DLPC4430 controller requires an array of power supply voltages (1.15V, 1.8V, 3.3V), there are no restrictions regarding the relative order of power supply sequencing for both power-up and powerdown scenarios. Similarly, there is no minimum time between powering-up or powering-down the different supplies feeding the DLP controller. However, note that it is not uncommon for there to be power sequencing requirements for the devices that share the supplies with the DLP controller.

- 1.15V core power is applied whenever any I/O power is applied to ensures the state of the associated I/O that are powered are controlled to a known state. Thus, it is recommended to apply core power first. Other supplies are applied only after the 1.1V core has ramped up.
- All DLPC4430 device power must be applied before POSENSE is asserted to ensure proper power-up initialization.

Typically the DLPC4430 controller power-up sequencing is handled by external hardware. An external power monitor will hold the controller in system reset during power-up (i.e. POSENSE = 0). During this time all DLP controller I/Os are tri-stated. The primary PLL (PLLM1) is released from reset upon the low to high transition of POSENSE but the controller keeps the rest of the device in reset for an additional 60 ms to allow the PLL to lock and stabilize its outputs. After this 60 ms delay the ARM-9 related internal resets are de-asserted causing the microprocessor to begin its boot-up routine.

## 9.3 Power-On Sense (POSENSE) Support

In order to set up the power monitor to trip within the DLPC4430 controller minimum supply voltage specifications, it is recommended that the external power monitor generating POSENSE targets its threshold to 90% of the minimum supply voltage specifications and ensures that POSENSE remains low a sufficient amount of time for all supply voltages to reach minimum device requirements and stabilize. Note that the trip

voltage for detecting the loss of power, as well as the reaction time to respond to a low voltage condition is not critical for POSENSE as PWRGOOD is used for this purpose. As such, PWRGOOD has critical requirements in these areas.

#### 9.4 System Environment and Defaults

#### 9.4.1 DLPC4430 System Power-Up and Reset Default Conditions

Following system power-up, the DLPC4430 controller performs a power-up initialization routine that defaults the device to a normal power mode, in which ARM9-related clocks are enabled at their full rate and associated resets are released. Most other clocks default to disabled state with associated resets asserted until released by the processor. In addition, the default for system power gating enables all power. These same defaults are also applied as part of all system reset events (Watch Dog timer timeout etc.) that occur without removing or cycling power, with the possible exception of power for the LVDS I/O and internal DRAM. For an extended reset condition, the OEM is expected to place the controller in Low Power mode prior to reset, in which case the 1.8V power for the LVDS I/O and internal DRAM are disabled. When this reset is released, the 1.8V power does not get enabled until the ARM9 has been initialized and is executing the system initialization routines.

Following power-up or system reset initialization, the ARM9 boots from an external flash memory after which it enables the 1.8V power (from the DLPA100), enables the rest of the controller clocks, and initializes the internal DRAM. Once system initialization is complete the Application software determines if and when to enter low power mode.

#### 9.4.2 1.15V System Power

The DLPC4430 controller can support a low cost power delivery system with a single 1.15V power source derived from a switching regulator. To enable this approach, appropriate filtering must be provided for the 1.1V power pins of the PLLs.

#### 9.4.3 1.8V System Power

It is recommended that the DLPC4430 controller power delivery system provides two independent 1.8V power sources. One of the 1.8V power sources is used to supply 1.8V power to the controller LVDS I/O and internal DRAM. Power for these functions is fed from a common source which is recommended to be a linear regulator. The second 1.8V power source is used (along with appropriate filtering as discussed in the PCB layout guidelines for internal ASIC PLL power section of this document) to supply all of the DLPC4430 controller internal PLLs. In order to keep this power as clean as possible, a dedicated linear regulator for the 1.8V power to the PLLs is recommended.

#### 9.4.4 3.3V System Power

The DLPC4430 controller can support a low cost power delivery system with a single 3.3V power source derived from a switching regulator. This 3.3V source supplies power to all LVTTL I/O and the Crystal Oscillator cell. The 3.3V power must remain active in all power modes for which 1.1V core power is applied.

#### 9.4.5 Power Good (PWRGOOD) Support

The PWRGOOD signal is defined as an early warning signal that alerts the DLPC4430 controller a specified amount of time before the DC supply voltages drop below specifications, which allows the controller to park the DMD and to place the system into reset, ensuring the integrity of future operation. For practical reasons, it is recommended that the monitor sensing PWRGOOD be on the input side of supply regulators.

#### 9.4.6 5V Tolerant Support

With the exception of USB\_DAT, the DLPC4430 controller does not support any other 5V tolerant I/Os. However, note that source signals ALF\_HSYNC, ALF\_VSYNC and I2C typically have 5V requirements and special measures must be taken to support them. Also, 5V to 3.3V level shifter is recommended.

## 10 Layout 10.1 Layout Guidelines

To achieve the needed thermal connectivity, 2-ounce copper planes in the PCB design are recommended .

## 10.1.1 PCB Layout Guidelines for Internal DLPC4430 Power

The following guidelines to achieve desired controller performance relative to internal PLLs are recommended:

- The DLPC4430 controller contains four PLLs (PLLM1, PLLM2, PLLD and PLLS), each of which have a dedicated 1.15V digital supply, and three (PLLM1, PLLM2 and PLLD) which have a dedicated 1.8-V analog supply. It is important to have filtering on the supply pins that covers a broad frequency range. Each 1.15V PLL supply pin must have individual high frequency filtering in the form of a ferrite bead and a 0.1µF ceramic capacitor. These components must be located very close to the individual PLL supply balls. The impedance of the ferrite bead must be greater than that of the capacitor at frequencies above 10MHz. The 1.15V to the PLL supply pins must also have low frequency filtering in the form of an RC filter. This filter can be common to all the PLLs. The voltage drop across the resistor is limited by the 1.15V regulator tolerance and the DLPC4430 device voltage tolerance. A resistance of 0.36 Ω and a 100 µF ceramic are recommended.
- The analog 1.8V PLL power pins must have a similar filter topology as the 1.15V. In addition, it is recommended that the 1.8V be generated with a dedicated linear regulator.
- When designing the overall supply filter network, care must be taken to ensure no resonance occurs. Particular care must be taken around the 1 to 2MHz band, as this coincides with the PLL natural loop frequency.

Figure 10-1. PLL Filter Layout

High frequency decoupling is required for both 1.15V and 1.8V PLL supplies and must be provided as close as possible to each of the PLL supply package pins. It is recommended to place decoupling capacitors under the package on the opposite side of the board. Use high quality, low-ESR, monolithic, surface mount capacitors. Typically 0.1µF for each PLL supply is sufficient. The length of a connecting trace increases the parasitic inductance of the mounting and thus, tracing should be avoided, allowing the via to butt up against the land itself. Additionally, the connecting trace has to be made as wide as possible. Further improvement can be made by placing vias to the side of the capacitor lands or doubling the number of vias.

The location of bulk decoupling depends on the system design.

#### 10.1.2 PCB Layout Guidelines for Auto-Lock Performance

One of the most important factors in getting good performance from Auto-Lock is to design the PCB with the highest signal integrity possible by following the recommendations below:

- Place the ADC chip as close to the VESA/Video connectors as possible.
- Avoid crosstalk to the analog signals by keeping them away from digital signals
- Do not place the digital ground or power planes under the analog area between the VESA connector to the ADC chip.
- Avoid crosstalk onto the RGB analog signals, by separating them from the VESA Hsync and Vsync signals.
- Analog power must not be shared with the digital power directly.
- Try to keep the trace lengths of the RGB as equal as possible.
- · Use good quality (1%) termination resistors for the RGB inputs to the ADC
- If the green channel must be connected to more than the ADC green input and ADC sync-on-green input, provide a good quality high impendence buffer to avoid adding noise to the green channel.

#### 10.1.3 DMD Interface Considerations

High speed interface waveform quality and timing on the DLPC4430 controller (i.e. the LVDS DMD Interface) is dependent on the total length of the interconnect system, the spacing between traces, the characteristic impedance, etch losses, and how well matched the lengths are across the interface. Thus ensuring positive timing margin requires attention to many factors.

As an example, DMD Interface system timing margin can be calculated as follows:

- Setup Margin = (DLPC4430 output setup) (DMD input setup) (PCB routing mismatch) (PCB SI degradation)
- Hold-time Margin = (DLPC4430 output hold) (DMD input hold) (PCB routing mismatch) (PCB SI degradation)

Where *PCB SI degradation* is signal integrity degradation due to PCB effects, which include simultaneously switching output (SSO) noise, cross-talk and inter-symbol interference (ISI) noise. The controller I/O timing parameters as well as DMD I/O timing parameters can be easily found in their corresponding data sheets. Similarly, *PCB routing mismatch* can be budgeted and met through controlled PCB routing. However, PCB SI degradation is not so straight forward.

In an attempt to minimize the signal integrity analysis, the following PCB design guidelines are provided as a reference of an interconnect system that satisfies both waveform quality and timing requirements (accounting for both PCB routing mismatch and PCB SI degradation). Variation from these recommendations may also work, but have to be confirmed with PCB signal integrity analysis or lab measurements

#### PDB Design:

Configuration	Asymmetric Dual Stripline
Etch Thickness	1.0 oz copper (1.2 mil)
Flex Etch Thickness	0.5 oz copper (0.6 mil)
Single Ended Signal Impedance	50 ohms (+/- 10%)
Differential Signal Impedance	100 ohms differential (+/- 10%)

#### PCB Stackup:

- Reference plane 1 is assumed to be a ground plane for proper return path
- Reference plane 2 is assumed to be the I/O power plane or ground
- Dielectric FR4, (Er): 4.2 (nominal)
  Signal trace distance to reference plane 1 (H1) 5.0 mil (nominal)
  Signal trace distance to reference plane 2 (H2) 34.2 mil (nominal)

PCB Stackup Geometries

Figure 10-2. PCB Stackup Geometries

Table 10-1. General PCB Routing (Applies to All Corresponding PCB Signals)								
PARAMETER	APPLICATION	SINGLE-ENDED SIGNAL	DIFFERENTIAL PAIRS	UNIT				
	Escape Routing in Ball Field	4 (0.1)	4 (0.1)	mil (mm)				
Line width (W) <sup>(1)</sup>	PCB Etch Data or Control	7 (0.18)	4.25 (0.11)	mil (mm)				
	PCB Etch Clocks	7 (0.18)	4.25 (0.11)	mil (mm)				
Minimum Line spacing to	Escape Routing in Ball Field	4 (0.1)	4 (0.1)	mil (mm)				
other signals (S)	PCB Etch Data or Control	10 (0.25)	20 (0.51)	mil (mm)				
	PCB Etch Clocks	20 (0.51)	20 (0.51)	mil (mm)				

..... \_ \_ \_ - -

(1) Line width is expected to be adjusted to achieve impedance requirements

#### Table 10-2. DMD I/F, PCB Interconnect Length Matching Requirements

SIGNAL GROUP LENGTH MATCHING								
I/F	SIGNAL GROUP	REFERENCE SIGNAL	MAX MISMATCH	UNIT				
DMD (LVDS)	SCA_P,SCA_N, DDA_P(15:0), DDA_N(15:0)	DCKA_P, DCKA_N	+/-150 (+/-3.81)	mil (mm)				
DMD (LVDS)	SCB_P,SCB_N, DDB_P(15:0), DDB_N(15:0)	DCKB_P, DCKB_N	+/-150 (+/-3.81)	mil (mm)				

Number of layer changes:

- Single ended signals: Minimize
- Differential signals: Individual differential pairs can be routed on different layers but the signals of a given pair typically does not change layers.

Termination requirements:

DMD Interface - None, the DMD receiver is differentially terminated to 100 ohms internally

Connector (DMD-LVDS I/F bus only) - High Speed Connectors that meet the following requirements must be used:

75-125 ohms

- Differential Crosstalk <5 %
- Differential Impedance

Routing requirements for right angle connectors:

When using right angle connectors, P-N pairs have to be routed in same row to minimize delay mismatch and propagation delay difference for each row has to be accounted for on associated PCB etch lengths.

Figure 10-4. Layer 4

## 10.1.5 Thermal Considerations

The underlying thermal limitation for the DLPC4430 controller is that the maximum operating junction temperature ( $T_J$ ) not be exceeded (this is defined in the Section 6.3). This temperature is dependent on operating ambient temperature, airflow, PCB design (including the component layout density and the amount of copper used), power dissipation of the DLPC6421 device and power dissipation of surrounding components. The DLPC4430 package is designed primarily to extract heat through the power and ground planes of the PCB, thus copper content and airflow over the PCB are important factors.

The recommended maximum operating ambient temperature  $(T_A)$  is provided primarily as a design target and is based on maximum DLPC4430 power dissipation and  $R_{\theta JA}$  at 1 m/s of forced airflow, where  $R_{\theta JA}$  is the thermal resistance of the package as measured using a JEDEC defined standard test PCB. This JEDEC test PCB is not necessarily representative of the DLPC4430 PCB, and thus the reported thermal resistance may not be accurate in the actual product application. Although the actual thermal resistance may be different, it is the best information available during the design phase to estimate thermal performance. However, after the PCB is designed and the product is built, it is highly recommended that thermal performance be measured and validated.

To do this, the top center case temperature has to be measured under the worst case product scenario (max power dissipation, max voltage, max ambient temp) and validated not to exceed the maximum recommended case temperature (T<sub>C</sub>). This specification is based on the measured  $\varphi_{JT}$  for the DLPC4430 package and provides a relatively accurate correlation to junction temperature. Note that care must be taken when measuring this case temperature to prevent accidental cooling of the package surface. A small (approx 40 gauge) thermocouple is recommended. The bead and the thermocouple wire must contact the top of the package and be covered with a minimal amount of thermally conductive epoxy. The wires must be routed closely along the package and the board surface to avoid cooling the bead through the wires.

# 11.1 Device Support

### 11.1.1 Video Timing Parameter Definitions

- Active Lines Per Frame (ALPF) Defines the number of lines in a Frame containing displayable data: ALPF is a subset of the TLPF.
- Active Pixels Per Line (APPL) Defines the number of pixel clocks in a line containing displayable data: APPL is a subset of the TPPL
- Horizontal Back Porch Blanking (HBP) Number of blank pixel clocks after Horizontal Sync but before the first active pixel. Note: HBP times are reference to the leading (active) edge of the respective sync signal
- Horizontal Front Porch Blanking (HFP) Number of blank pixel clocks after the last active pixel but before Horizontal Sync.
- Horizontal Sync (HS) Timing reference point that defines the start of each horizontal interval (line). The
  absolute reference point is defined by the "active" edge of the HS signal. The "active" edge (either rising or
  falling edge as defined by the source) is the reference from which all Horizontal Blanking parameters are
  measured.
- **Total Lines Per Frame (TLPF)** Defines the Vertical Period (or Frame Time) in lines: TLPF = Total number of lines per frame (active and inactive).
- Total Pixel Per Line (TPPL) Defines the Horizontal Line Period in pixel clocks: TPPL = Total number of
  pixel clocks per line (active and inactive).
- Vertical Back Porch Blanking (VBP) Number of blank lines after Vertical Sync but before the first active line.
- Vertical Front Porch Blanking (VFP) Number of blank lines after the last active line but before Vertical Sync.
- Vertical Sync (VS) Timing reference point that defines the start of the vertical interval (frame). The absolute reference point is defined by the "active" edge of the VS signal. The "active" edge (either rising or falling edge as defined by the source) is the reference from which all Vertical Blanking parameters are measured.

## **11.4 Support Resources**

TI E2E<sup>™</sup> support forums are an engineer's go-to source for fast, verified answers and design help — straight from the experts. Search existing answers or ask your own question to get the quick design help you need.

Linked content is provided "AS IS" by the respective contributors. They do not constitute TI specifications and do not necessarily reflect TI's views; see TI's Terms of Use.

# 11.5 Trademarks

ARM946<sup>™</sup> is a trademark of ARM.

TI E2E<sup>™</sup> is a trademark of Texas Instruments.

DLP® are registered trademarks of Texas Instruments.

All trademarks are the property of their respective owners.

#### **11.6 Electrostatic Discharge Caution**

This integrated circuit can be damaged by ESD. Texas Instruments recommends that all integrated circuits be handled with appropriate precautions. Failure to observe proper handling and installation procedures can cause damage.

ESD damage can range from subtle performance degradation to complete device failure. Precision integrated circuits may be more susceptible to damage because very small parametric changes could cause the device not to meet its published specifications.

## 11.7 Glossary

TI Glossary This glossary lists and explains terms, acronyms, and definitions.

# 12 Mechanical, Packaging, and Orderable Information

The following pages include mechanical, packaging, and orderable information. This information is the most current data available for the designated devices. This data is subject to change without notice and revision of this document. For browser-based versions of this data sheet, refer to the left-hand navigation.

# PACKAGING INFORMATION

Orderable Device	Status (1)	Package Type	e Package Drawing	Pins	Package Qty	Eco Plan (2)	Lead finish/ Ball material	MSL Peak Temp (3)	Op Temp (°C)	Device Marking (4/5)	Samples
DLPC4430ZPC	ACTIVE	BGA	ZPC	516	40	TBD	Call TI	Call TI	0 to 70		Samples

<sup>(1)</sup> The marketing status values are defined as follows:

ACTIVE: Product device recommended for new designs.

LIFEBUY: TI has announced that the device will be discontinued, and a lifetime-buy period is in effect.

NRND: Not recommended for new designs. Device is in production to support existing customers, but TI does not recommend using this part in a new design.

**PREVIEW:** Device has been announced but is not in production. Samples may or may not be available.

**OBSOLETE:** TI has discontinued the production of the device.

<sup>(2)</sup> RoHS: TI defines "RoHS" to mean semiconductor products that are compliant with the current EU RoHS requirements for all 10 RoHS substances, including the requirement that RoHS substance do not exceed 0.1% by weight in homogeneous materials. Where designed to be soldered at high temperatures, "RoHS" products are suitable for use in specified lead-free processes. TI may reference these types of products as "Pb-Free".

**RoHS Exempt:** TI defines "RoHS Exempt" to mean products that contain lead but are compliant with EU RoHS pursuant to a specific EU RoHS exemption.

Green: TI defines "Green" to mean the content of Chlorine (CI) and Bromine (Br) based flame retardants meet JS709B low halogen requirements of <=1000ppm threshold. Antimony trioxide based flame retardants must also meet the <=1000ppm threshold requirement.

<sup>(3)</sup> MSL, Peak Temp. - The Moisture Sensitivity Level rating according to the JEDEC industry standard classifications, and peak solder temperature.

<sup>(4)</sup> There may be additional marking, which relates to the logo, the lot trace code information, or the environmental category on the device.

<sup>(5)</sup> Multiple Device Markings will be inside parentheses. Only one Device Marking contained in parentheses and separated by a "~" will appear on a device. If a line is indented then it is a continuation of the previous line and the two combined represent the entire Device Marking for that device.

(<sup>6)</sup> Lead finish/Ball material - Orderable Devices may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead finish/Ball material values may wrap to two lines if the finish value exceeds the maximum column width.
